To be determined at design

Integrated Natural Resources Management Project (INReMP) will focus on greening and commercialization of nature-based value chains and the promotion of regenerative agriculture and climate-smart solutions that build the adaptive and mitigation capacities of farmers and value chain players. It will scale-up the successful approaches under existing IFAD projects in Kenya, with a stronger emphasis on nature-based value chains and enterprises, whilst taking on a public-private-producer partnerships (4P) implementation approach. Innovative approaches and partnerships geared towards leveraging climate finance from private sector, climate trust funds and through carbon markets will be explored.

INReMP has three main components.
Component 1: Community-led Enhanced Environment and INRM, Ecosystem Services, and Climate Action. It aims to support capacity building at community level to empower communities and households;
Component 2: Improved, Inclusive and Sustainable Rural Livelihoods. It aims to support communities and households to improve their livelihoods and incomes using interventions that are beneficial to the management of the natural resource base; and
Component 3: Institutional Strengthening, Policy Support and Programme Coordination. It aims to be a cross-cutting component servicing the technical components and facilitating pathways for the effective and efficient implementation of INReMP interventions.
